

Question 7:

Description of my module:

The module I responsible is Login&Authenticate. The design of the module is import the persist and save the created data into the persistence. The method creating data is named `createAccount()`, which is able to create two type users: instructor and student. After create the instructor account, save the data into the Persist: {"instructor"} and save the student data into {"student"}.

As for connect the flask, I set up the `app.py` which is the route to access.
