Question 6:

I am responsible for doing the first part: Login, authenticate and persistence. Hence I create two files, one named: login.py and another is Persist.py.

For the login.py, it only import Persist and it has no connection with other modules. In detail, the public method createAccount() create data and save it into the
Persist :{"instructor"} ,{"student"} and also get data according to call the Persist method: addStudentAccount() and addInstrustorAccount().

For the Persist.py, it only import shelve which create dictionary for other modules to save data or get data.
